

Flow Rate and Valve Sizing

In order to design valves for a process system correctly, the valve size is determined by the required flow rate. The K_V -value serves as a calculation basis for the different process conditions.

This value is stated in the following table with regard to nominal diameter and standards.

K_V -value

The K_V -value is a parameter defining the flow rate of valves. It describes the amount of water from 5° to 30°C which flows through the valve at a pressure loss of 1 bar. The K_{VS} -value describes the K_V -value when the valve is 100% open.

For water 5-30°C applies:

$$K_V = \frac{Q}{\sqrt{\Delta p}}$$

General Liquid Flow Formula:

$$K_V = Q \sqrt{\frac{\rho}{1000 \Delta p}}$$

Test stand to determine and document flowrates and K_V (C_V) values

Conversion:

For the correct K_V to C_V conversion calculation, use only the stated units formulas below.

The K_V -value must be converted from (cubic meter / hour) by utilizing the following conversion factors.

In the US the flow rate of water is measured with the C_V -value in US-gallons per minute (gpm) with a pressure drop of Δp 1 PSI.

Conversion of K_V to C_V

$$C_V = 1,17 \times K_V$$

Conversion of C_V to K_V

$$K_V = 0,86 \times C_V$$

Explanations:

K_V	m ³ /h	flow rate parameter
Q	m ³ /h	volume flow rate
ρ	kg/m ³	specific gravity
p_1	bar	pressure before the valve
p_2	bar	pressure after the valve
Δp	bar	pressure drop through the valve
		$\Delta p = p_1 - p_2$

K_{VS} -Value (m ³ /h)			Nominal diameter			Valve type
DN	NPS	MA	Iso 1127 Code 40	DIN 11850 Code 41-43	ASME-BPE Code 45	
4	-	8	-	-	-	190/207 290/297
6	-	8	-	-	-	
8	1/4"	8	2,4	-	0,7	
10	3/8"	8	-	2,3	1,4	
15	1/2"	8	-	-	2,0	
8	1/4"	10	2,7	-	-	188/195/307 289/295/397
10	3/8"	10	3,9	2,5	1,4
